
With no consequences at all, drug use sits at the TOP: users earn 3.5 times the average, because drugs are a normal good and a richer household gives up less utility per dollar. Both consequences flip that, but not at the same price. The mortality channel crosses the line at under a fifth of its calibrated strength; the unemployment channel never gets there. The temptation parameter is recalibrated at every point, so participation is 5.13 per cent all along both curves and the only thing moving is WHICH households use.
